

Proposed Solution

Project: Employee Software Installation Request (ServiceNow)

1. Solution Overview

A ServiceNow-based, data-driven workflow that lets employees request licensed software installation through the Service Catalog. Requests are automatically routed to the employee's manager for approval, approved requests generate a fulfillment task for the Network/Software Support team, and unfulfillable requests (e.g., license shortage) automatically raise an Incident.

2. Objectives

- Replace informal, email-based software requests with a structured, trackable process.
- Provide managers a single, standard interface (My Approvals) to review and decide on requests.
- Give the IT/Network team a clear, assigned fulfillment task for every approved request.
- Automatically flag and escalate requests that cannot be fulfilled due to license shortages.

3. Solution Components

Component	Role in the Solution
Service Catalog Item	Captures the request: Software Name, Version, Business Justification, Installation Device, License Type, Required By Date
Requested Item (sc_req_item)	Core record tracking status through the full lifecycle
Flow Designer (Approval Flow)	Routes the request to the Manager, branches on Approved/Rejected, triggers downstream actions
Catalog Task (sc_task)	Assigned to the Network/Software Support team upon approval, for actual installation
Business Rule	Automatically raises an Incident when a request is placed On Hold due to license shortage
Email Notifications	Keep the employee informed at each key stage

4. End-to-End Flow

1. Employee submits the request via the Service Catalog.
2. Request is automatically routed to the employee's Manager for approval (My Approvals).
3. If Approved: a Catalog Task is created for the Network/Software Support team; employee is notified.
4. If Rejected: employee is notified with the reason; no further action taken.
5. If the request cannot be fulfilled (e.g., On Hold due to license shortage): an Incident is automatically raised for the Software Support group.

5. Benefits

- Faster turnaround — no more requests lost in email threads.
- Full auditability — every decision and status change is timestamped.
- Reduced manual effort for both managers and the IT/Network team.
- Proactive escalation of license shortages instead of silent failures.

6. Alignment with Requirements

This solution directly satisfies the Functional Requirements (FR-01 through FR-09) and Non-Functional Requirements defined in the Solution Requirements document, using only native ServiceNow capabilities — no external tools or custom infrastructure required.
